

# REMOTE PUMP CONTROL

**Pump control and status monitoring screen. From this page, users can see the state of the ignition switch, turn the pump on and off and view the run state of the motor. Alerts by email and/or SMS can be raised on pump shut down. The chart below the pump control displays the diesel level in the diesel tank also. With this system, users can remotely turn the pump on and the pump turns off on pressure when the tank is full. The system can be used to set pump run times or turn pump off based on levels. Can be used with diesel and electric pumps with communication to both diesel engine control panels or variable speed drives on electric pumps.**
